

TRIO

Integration Guide

This document is a manual for integrating into the TRIO project. It provides guidelines and instructions to ensure seamless participation in the project.

Contact 1st line: integration-support@ehealth.fgov.be

1. Contents

No table of contents entries found.

2. Document version

Version	Status	Date	Author	Description
0.1	Draft	02/12/25	Smals	Initial version
1.0	Published	xx/01/26	Smals	First release

3. Target groups

The following target groups are currently supported:

Target groups
External prevention services
CIN/NIC
General practitioner software

4. What is the TRIO Platform?

TRIO Platform is a communication and collaboration platform, developed to make the exchange of administrative and medical information easier between actors involved in return to work processes.

TRIO Actors are: doctors (general practitioners, work doctors of external prevention services, advising doctors of health insurance organization), return to work coordinators, work nurses, multidisciplinary team members and administrative team members of health insurance organization, and administrative team member of external prevention service.

Thanks to TRIO, the identification of the appropriate actors for the health insured person and the communication between actors will be much easier, improving the chances to receive critical information within reasonable timeframes and increasing the number of people going back to work.

TRIO provides a REST API for integrators to integrate in their own systems to seamlessly collaborate around a return to work process. The main functionalities of TRIO are:

- Define a Health insured person space around a dossier and multiple return to work trajects
- Send and receive notifications without having to know the actual person behind the role/organization
- Share medical and non-medical information with precise access management

5. Required Documents and How to Use Them

1. Overview

To integrate with the TRIO REST API, all software integrators must follow the eHealth onboarding process. This process requires the use of several official documents. This chapter explains exactly which document to use at each step, using simple instructions such as “Use document X to register your client” or “Read document Y to request tokens.”

Only the Machine-to-Machine (M2M) authentication flow is permitted for TRIO API clients. End-user authentication flows (Authorization Code, etc.) are not applicable.

2. Register Your IAM Connect Client (M2M Only)

Use these two documents together:

1. Onboarding I.AM TRIO Procedure

 Read the **Onboarding I.AM TRIO Procedure** to understand how to prepare your registration and which M2M parameters to provide.

Use this document to understand:

- Why your integration must use M2M Client Credentials
- What certificate information you must provide
- What information must be included in your onboarding request email

2. I.AM Connect – M2M Client Registration Request Form (v2.1)

 Use the **I.AM Connect – M2M Client Registration Form** to register your TRIO IAM client. This is the official eHealth form used to create your IAM Connect client.

You must request the following scopes:

- iam:authz
- nihdi:trio
- openid
- profile
- pseudo:api:identify
- pseudo:api:pseudonymize

Submit the completed form to the eHealth Integration Support team together with the onboarding email.

3. Request Your IAM Tokens

 Read the **Identity & Authorization Management (IAM) Mobile integration Technical specifications** to understand how to request your access tokens.

The IAM token will give access to the TRIO API but also the rights to the pseudonymization service. For security reasons, technical providers (such as Smals) cannot access these pseudonymization rights. To avoid that happening, **2 tokens are required**:

1. A token for the pseudonymization calls
2. A token for the TRIO API

The integrator must explicitly select the appropriate scopes and audience when requesting each token.

	Token for the pseudonymization	Token for the TRIO API
Scope	• iam:authz • nihdi:trio • openid • profile • pseudo:api:identify • pseudo:api:pseudonymize	• iam:authz • nihdi:trio • openid • profile
Audience	• nihdi-trio-api • ehealth-pseudo-api	• nihdi-trio-api

A token containing pseudonymization scopes will be rejected by the TRIO API.

4. Implement Pseudonymization

The integrator is responsible for transforming identifiers using the eHealth pseudonymization service.

 Use the **eHealth Pseudonymization documentation** and helper libraries to pseudonymize SSINs before calling the TRIO API.

 **Pseudonymization libraries** exist for Java, TypeScript and .NET.

Some TRIO API calls must use a pseudonymized SSIN. (See  **TRIO API CookBook**)

5. Implement and Test the TRIO API

Use the TRIO API Cookbook and test scenarios to implement and validate your TRIO API integration.

Production activation is only possible once acceptance tests have been successfully executed.

TODO

TRIO API Cookbook + Test Scenarios

These resources provide the technical details needed to call the TRIO API correctly.

They include:

- Endpoint descriptions
- Required headers and authentication patterns
- Pseudonymization rules specific for TRIO
- Example requests and responses
- Error handling guidance
- Testing instructions for the ACC environment
